GENERAL INFORMATION

The Selador Series medium power, low-profile Paletta fixture is ideal for stage and studio lighting as side light, down light, fill light or cyc lighting – producing the widest range of spectrally balanced saturated and tinted colors that lighting designers love. The Paletta fixture uses the x7 Color System™ configured for the deepest, purest colors and tints available. The exclusive 7-color array maximizes Paletta for deep color output but does not give up Selador Series’ unique ability to match warm, tungsten white light, vibrant daylight white, and soft, tinted gel colors.

NOTES ABOUT LED LUMINAIRES

All LED sources experience some lessening of light output and some color shift over time. LED output will vary with thermal conditions. With typical usage, a Selador luminaire will still achieve 70% of its initial output after 50,000 hours. In individual situations, LEDs will be used for different durations and at different levels. This can eventually lead to minor alterations in color performance, necessitating slight adjustment to presets, cues or programs.

PHOTOMETRICS

Photometric data taken with all channels at full. Data reflects the output of one 11" unit. See chart on page 2 for lumen and efficiency information in sample gel colors. Information for PAR fixtures with the same gel colors is presented for comparison. Due to the variability of all LEDs, output data and color matched should be viewed as approximate. Photometric data for individual lenses and lens combinations may be found at www.etcconnect.com/docs/docs_downloads/techdocs/Selador-Lens-Photometrics.xls

25°	19,050	1,111	565	15.9

Metric Conversions: For Meters multiply feet by .3048
For Lux multiply footcandles by 10.76

For illumination with any lamp, multiply the candlepower of a beam spread by the multiplying factor (mf) shown for that lamp.

To determine illumination in footcandles or lux at any throw distance, divide candlepower by distance squared.

For Field diameter at any distance, multiply distance by .456

For Beam diameter at any distance, multiply distance by .231

Cosine Candela Plot

*** Throw Distance Multiplier (TDM)

To determine the distance from the center of the beam (Origin) to a certain illuminance level at a particular distance, multiply the desired throw distance by the TDM desired on the Iso-Illuminance diagram.

Throw Distance (TD) x Throw Distance Multiplier (TDM) = Distance from the Origin (DfO) (distance from the center of the beam)

Example: 25 feet (TD) x 0.139 (TDM) = 3.475 feet from center of beam (DfO)
